Description

Hi all,

I'm trying to install 2.4.1 release on laptop Dell E6400. I have problems to install FreeBSD or DragonflyBSD on it for about last 6 months. Everytime kernel panic and I end in ddb, but keyboard is not working then. I can use this Live CD or install it on hdd when I disable ACPI. In NetBSD or OpenBSD it's working and on OpenBSD suspend/resume is not running.

I can't post much more details. Just what you can see in attachment as keyboard is not working and I don't have serial console or USB -> RS232 converter.

Which version of FreeBSD have you tried, 7.2 or 8.0?

#2 - 11/03/2009 02:52 PM - bodie

7.2 and some 6. Can't remember exactly now. But no one was current.

Try to drop into loader prompt and set debug.acpi.disabled="cmbat".

#4 - 11/03/2009 06:13 PM - bodie

set debug.acpi.disabled="cmbat" is working at least for installer. I'm installing now to test other bugs.

#5 - 11/03/2009 06:35 PM - bodie

Hmmm, after installation when I'm going to boot from disk trough CD installer after these steps in loader prompt : unload ; lsdev ; set curredev="disk0s2a" ; set debug.acpi.disable="cmbat" ; boot I get again kernel panic on attached screenshot and keyboard is not working.

- Description updated

- Category set to Kernel

- Assignee deleted (0)

- Target version set to 3.8.0

Hi,

Would it be possible to try with latest master ?

Cheers,
Antonio Huete
