Description	
Hi,	
Does anybody has a working pflogd on x86_64? Or is it only me?	
Symptoms:	
- /var/log/pflog created, but empty.	
- pflogd stuck in initialisation:	
# ps ax grep pflogd	
11923 ?? SLMs 0:00.01 pflogd: [priv] (pflogd)	
11924 ?? SLM 0:00.00 pflogd: [initializing] (pflogd)	
11937 1 SLM+ 0:00.00 grep pflogd	
- suspect debug messages:	
# pflogd -D	
[priv]: msg PRIV_OPEN_LOG received	
pflogd: send_fd: sendmsg(4): Invalid argument	
pflogd: send_fd: sendmsg: expected sent 1 got -1	
The privileged pflogd seems unable to send its /var/log/pflog file descriptor to its children process, which is waiting.	
Maybe it's not a x86_64 thing, I haven't tried on a 32 bits platform.	
Regards,	
Fanch
