

DragonFlyBSD - Bug #2097

Bug in DragonFly BSD Handbook.

06/28/2011 02:44 PM - robin.carey1

Status: New	Start date:
Priority: Normal	Due date:
Assignee:	% Done: 0%
Category:	Estimated time: 0.00 hour
Target version:	
Description Dear DragonFlyBSD bugs, In your handbook, under the "13. Security" heading, and then the "4. DES, MD5 and Crypt" sub-heading, the handbook states: "By default DragonFly uses MD5 to encrypt passwords." But that statement is no longer true, since there was a Google-Code-In (Dec 2010 ?) project to alter the default encryption of passwords to use SHA256. -- Also, there is a typographical error on: http://www.dragonflybsd.org/features/ Sub-heading: DMA - DragonFly Mail Agent, "...mail delivery and simply remote mail transfers..." Presumably "simply" should be "simple".

I've made the changes to the pages; thank you for listing them!

The site's a wiki, so if you want to do it yourself directly, you can.
