Description

Hi dear DragonflyBSD Team,
I have downloaded [http://mirror-master.dragonflybsd.org/iso-images/dfly-x86_64-4.8.0_REL.img.bz2] and test its checksum then saw it is right.
But when I decompress it with [bzip2 -d], It reported [65c6496375b7d5df649345c4832bb244] and it can not bootable image!
Is this BUG only for me?

Hi mbzadegan,

How do you try to boot this ".img" image?

The ".img" image should be dd'ed to a USB stick, which is then used to boot the machine and install DFly from there.

On the other hand, if you want to boot a virtual machine (e.g., VirtualBox), you should go with the ".iso" version image.

Cheers,
Aly
