Description			
Sorry for my bad English...			
After DragonFly BSD Development image install on Intel NUC5PPYH and if to reboot and _remove_ usb install stick, da0 detects on very big volume and this is stop system loading.			
UEFI/HAMMER2 install mode. HDD 500GB 2.5" WD Black. USB Stick 8GB.			
The workaround: _do not remove_ usb install stick after installation and after reboot then da0 and da8 is correctly detected.
