

DragonFlyBSD - Bug #1899

Keyboard doesn't work

11/05/2010 07:08 PM - fransm

Status:	New	Start date:	
Priority:	Normal	Due date:	
Assignee:		% Done:	0%

Target version:			
Description			
When trying to boot Dragonfly 2.8.2 i386 from CD on my desktop, the process succeeds to the login: prompt. However I can not login because the keyboard doesn't work. Desktop is an Acer M7720 with Intel core i7 and 6 GB memory. Keyboard and mouse are connected via USB.

Try different USB ports. It's occasionally worked in the past where someone can't get USB devices working on, say, the front ports of a computer but the ones on the back (on a different controller) do work.

Past that - see if there's different modes for USB in BIOS, or maybe don't load ehci.ko on boot.

Another option is to try without loading ehci, it might well be causing issues.

Cheers,
Alex Hornung
