Kernel panic when trying to ping6

I got a kernel panic on my vkernel trying to ping6 another vkernel on the same host. I might have done an incorrect network configuration, but I guess it shouldn't panic anyway.

Here is what I've done.

Two fresh vkernels with ipv6_enable=yes in rc.conf started with:

```
/boot/kernel/kernel -m 1g -r /vhost/vm0.img -I /var/run/vknet
```

and

```
/boot/kernel/kernel -m 1g -r /vhost/vm1.img -I /var/run/vknet
```

vknetd is executed as "/usr/sbin/vknetd -U -t tap0".

I run the following version of DragonFly (on all three machines: host and both vkernels):

```
1. uname -a
   DragonFly 5.8-RELEASE DragonFly v5.8.0rc1.28.g3e3e37-RELEASE #2: Sun Mar  1 17:46:44 CET 2020 root@fi.zta.lk
   /usr/obj/usr/src/sys/VKERNEL64  x86_64
```

On one of the vkernels I first check that I can ping the other one:

```
1. ping6 fe80::201:71ff:fe0c:f607%vke0
   PING6 fe80::201:68ff:fe8:5f8%vke0 --> fe80::201:71ff:fe0c:f607%vke0
   16 bytes from fe80::201:71ff:fe0c:f607%vke0, icmp_seq=1 hlim=64 time=0.371 ms
   16 bytes from fe80::201:71ff:fe0c:f607%vke0, icmp_seq=2 hlim=64 time=0.262 ms
   ^C
```

3 packets transmitted, 2 packets received, 33.3% packet loss
round-trip min/avg/max/std-dev = 0.262/0.317/0.371/0.054 ms

Then do the following to get the panic:

```
1. route add -inet6 fe80::201:71ff:fe0c:f607%vke -iface vke0
   add host fe80::201:71ff:fe0c:f607: gateway vke0
```

```
1. ping6 fe80::201:71ff:fe0c:f607
   PING6 fe80::201:68ff:fe8:5f8%vke0 -- fe80::201:71ff:fe0c:f607%vke0
   panic: assertion "sdl->sdl_family == AF_LINK &amp; sdl->sdl_alen != 0" failed in nd6_resolve at /usr/src/sys/netinet6/nd6.c:2031
```
