pfi_kif_unref: state refcount <= 0 in dmesg

Description
I see this in dmesg:
pfi_kif_unref: state refcount <= 0

Maybe about 100-125 in a day, in an estimate. This machine is using pf to NAT, with a few extra rules that are not in use. There doesn't seem to be any harm in these messages, but they've been going on for a long time. (several releases at least.)
